PROFESSIONAL SUMMARY

Software Development Engineer with 3+ years of experience designing and building secure, reliable, large-scale distributed systems using Java, C++, and Python. Strong foundation in object-oriented design, design patterns, and full software development lifecycle including coding standards, code reviews, build processes, testing, and operations. Proven track record implementing security controls, authentication systems, and scalable microservices. Thrives in cross-functional environments, removes roadblocks proactively, and delivers customer-centric engineering solutions with high ownership and autonomy.

PROFESSIONAL EXPERIENCE

Software Engineer | Costco

Jan 2026 – Present

- Spearheaded end-to-end migration of Costco's monolithic e-commerce platform to secure, distributed microservices architecture using Java Spring Boot, cutting system downtime by 30% and reducing unauthorized access attempts by 50% via JWT/OAuth2.0 authentication across multi-tiered services.
- Integrated LLM-based features and AI-assisted development workflows using OpenAI APIs and GitHub Copilot, enabling intelligent product recommendations and reducing development cycle time by 30% while enforcing full code review accountability on all AI-generated output.
- Automated CI/CD pipelines using Jenkins and GitHub Actions with reliable rollback strategies, slashing deployment errors by 80% and enabling continuous daily production releases across migrated microservices.
- Partnered cross-functionally with product and infrastructure teams to define coding standards, mentor junior engineers on microservices design patterns, and accelerate sprint throughput consistently delivering high-quality, scalable solutions aligned to business priorities.

Software Development Engineer | AMD

Jan 2025 – Jan 2026

- Built and maintained secure, multi-tiered backend services in Java and Python using object-oriented design principles for AMD's semiconductor platform, improving system reliability and data processing throughput at scale.
- Designed role-based access control and federated identity APIs with secure coding standards across AMD's distributed engineering systems, improving authentication accuracy by 40%.
- Integrated ML-based predictive models into AMD's production backend pipelines using TensorFlow and scikit-learn, reducing data preprocessing time by 25% through scalable pipeline automation.
- Established comprehensive unit and integration testing practices across AMD's owned production components, maintaining high code coverage and reliability in a fast-paced delivery environment.

Software Engineer | JPMorgan Chase - TCS

Feb 2021 – Aug 2023

- Architected large-scale distributed microservices for high-volume financial transaction processing using Java Spring Boot and AWS EKS, reducing API latency by 35% through systematic performance benchmarking and SQL query optimization.
- Owned the full technology stack for mission-critical banking services covering design, implementation, testing, and operational characteristics ensuring reliability, security, and scalability across the platform.
- Built secure, event-driven data pipelines using AWS SQS, SNS, and EventBridge, cutting reporting latency by 80% and delivering high-quality trusted data products for financial analytics workflows.
- Owned end-to-end CI/CD automation in AWS CodePipeline and GitHub Actions with Docker and Kubernetes, reducing deployment failures by 90% through automated testing and staged rollouts.
- Migrated legacy banking services to cloud-native architecture on AWS Lambda, improving pipeline scalability and reducing infrastructure costs by 20%.

EDUCATION

M.S. in Computer Science | GPA: 3.85 | University of Central Missouri

B.Tech. in Electronics & Communication Engineering | Velagapudi Ramakrishna Siddhartha Engineering College

PROJECTS

AI-Powered Financial Insights Dashboard | Python, FastAPI, React, OpenAI API, PostgreSQL

- Built a full-stack application that ingests transaction data and uses LLM-based summarization to generate plain-English financial insights and anomaly alerts for end users.
- Designed a RAG (Retrieval-Augmented Generation) pipeline to ground AI responses in real user data, reducing hallucinations and improving response accuracy by 40%.
- Deployed containerized backend on AWS ECS with Docker, achieving sub-200ms API response times under high concurrency.

Intelligent Code Review Assistant | Python, LangChain, GitHub API, React, Azure

- Developed an agentic AI tool that automatically reviews pull requests, flags security vulnerabilities, suggests refactors, and posts structured feedback as GitHub comments.

- Integrated LangGraph-based multi-step reasoning to evaluate code against coding standards, reducing manual review time by 50% across a 10-engineer team.
- Deployed as a GitHub Actions workflow, making it a zero-friction addition to existing CI/CD pipelines.

SKILLS

Java, C++, Python, JavaScript, TypeScript, C#, SQL, JWT, OAuth2.0, Role-Based Access Control, Federated Identity, Secure Coding Practices, Authentication & Authorization, Object-Oriented Design, Design Patterns, Distributed Systems, Multi-Tiered Architecture, Reliability & Scaling, Microservices, AWS (Lambda, ECS, S3, RDS), Azure (AKS, Functions, Service Bus, Logic Apps, Event Grid), Docker, Kubernetes, Git, GitHub Actions, Jenkins, Azure DevOps, JIRA, Postman, Source Control Management PostgreSQL, Azure SQL, Cosmos DB, MongoDB, SQL Server, JUnit, PyTest, xUnit, Selenium, JMeter, Production Monitoring, Incident Response, TDD Agile/Scrum, Full SDLC, Code Reviews, Coding Standards, Technical Documentation, Cross-Functional Collaboration
